PROFESSIONAL SUMMARY

Mechanical Engineering graduate with 12 months of controls-focused experience at Ontario Power Generation and hands-on PLC/HMI portfolio work. Experienced in historian-data analysis, PLC logic tracing, HMI development, control-loop evaluation, troubleshooting, testing, verification, and technical documentation in regulated and laboratory environments.

EXPERIENCE

Engineering Intern - Control Systems Testing & Validation

May 2024 - May 2025

Ontario Power Generation (OPG)

Etobicoke, Ontario

- Analyzed 14 days of high-resolution governor telemetry using OSIsoft PI DataLink/PI Vision and Excel/VBA; correlated hydraulic-pressure drop slopes with pump status and wicket-gate stroke velocity to isolate a transient performance issue.
- Traced ControlLogix PIDE logic and monitored live tags in Studio 5000 under supervision; combined trend evidence with pressure-volume calculations showing a 1.39 L (12.0%) reduction in usable accumulator capacity between 1,500 and 1,000 psig.
- Developed FactoryTalk View SE HMI drafts in a local sandbox, including dynamic accumulator-status graphics, pressure-drop-rate indication, combined trends, and ALMD deadband/delay recommendations used as the blueprint for an approved production update.
- Produced an Excel analysis package, engineering-change proposal sections, equipment-specification calculations, and a five-slide technical briefing; findings supported scheduled accumulator maintenance and were presented to controls management.
- Reviewed post-maintenance PI trends with senior engineers and verified materially improved hydraulic-pressure stability during rapid load changes; final approvals, deployment, and field implementation remained with authorized staff.

Engineering Research Assistant - Systems Analysis

May 2023 - April 2024

York University — AM-SET Laboratory

North York, ON

- Built MATLAB-based analytical models and supported experimental validation to compare predicted and measured system behavior against engineering requirements.
- Documented assumptions, model limitations, test methods, and validation findings in formal technical reports for faculty review.

PROJECTS

Industrial Automation Portfolio | *PLC & HMI Process Control*

June 2026 – August 2026

- Programmed and simulator-validated a Micro850 three-stage tank process in Rockwell CCW using ladder logic, mutually exclusive states, interlocks, timers, level transitions, fault handling, and operator controls.
- Designed an HMI for real-time process status, tank-level visualization, manual controls, valve/motor indication, and alarms; documented logic, test evidence, and platform limitations for portfolio review.

Automated Electromechanical Control System | *Engineering Capstone*

September 2025 – April 2026

- Integrated mechanical, electrical, and embedded-control subsystems within a six-member team; tested launch performance, subsystem compatibility, and compliance with defined engineering requirements.

Closed-Loop Control System | *Hardware-Validated*

September 2025 - January 2026

- Tuned and validated a physical closed-loop control system for stability, transient response, and repeatability, measuring response times below 0.05 s

TECHNICAL SKILLS

Controls: Studio 5000 Logix Designer (logic tracing/read-only), FactoryTalk View Studio, Rockwell CCW, ladder logic, PLC/HMI development, PIDE analysis, sequential/state control

Analysis & Validation: OSIsoft PI DataLink/PI Vision, Excel/VBA, MATLAB, Simulink, historian analysis, testing, verification, fault isolation, engineering calculations, technical reporting

EDUCATION

York University — Lassonde School of Engineering

September 2021 - April 2026

Bachelor of Engineering (Honours) Mechanical Engineering

North York, ON
